Software department

# Contents

---

- ❑ The Shortest Path Problem Statement
- ❑ Serial Floyd Algorithm Implementation
- ❑ Parallel Floyd Algorithm
- ❑ Parallel Floyd Program

# THE SHORTEST PATH PROBLEM STATEMENT

# Step 1. Problem Statement...

- Let  $G$  be a graph

$$G = (V, R),$$

$V$  – the set of vertices

$$v_i, 1 \leq i \leq n$$

$R$  – the set of arcs

$$r_j = (v_{s_j}, v_{t_j}), 1 \leq j \leq m$$

- Generally, the arcs may be assigned certain numerical characteristics (weights)

$$w_j, 1 \leq j \leq m$$

# Step 1. Problem Statement...

## □ Example of the Weighted Oriented Graph

# Step 1. Problem Statement...

- Presenting dense graphs, almost all the nodes of which are linked by arcs (i.e.  $m \approx n^2$ ), may be efficiently described by means of the adjacency matrix

$$A = (a_{ij}), \quad 1 \leq i, j \leq n, \quad a_{ij} = \begin{cases} w(v_i, v_j), & \text{если } (v_i, v_j) \in R, \\ 0, & \text{если } i = j, \\ \infty, & \text{иначе.} \end{cases}$$

# Step 1. Problem Statement...

## □ The Adjacency Matrix

$$\begin{pmatrix} 0 & 3 & \infty & 2 & \infty & 7 \\ \infty & 0 & \infty & \infty & \infty & \infty \\ 8 & \infty & 0 & 1 & 4 & \infty \\ \infty & \infty & \infty & 0 & \infty & 1 \\ \infty & \infty & \infty & 2 & 0 & 5 \\ \infty & \infty & \infty & \infty & 1 & 0 \end{pmatrix}$$

# Step 1. Problem Statement...

---

## **The problem of searching the shortest paths**

- ❑ The initial information for the problem is the weighted graph
- ❑ Each arc of the graph is assigned non-negative weight
- ❑ The graph is assumed to be oriented
- ❑ The problem is to find out the shortest paths among all the pairs of destination vertices for the given graph  $G$
- ❑ As a method for solving the problem, we will further use Floyd algorithm

# Step 1. Problem Statement

- Generally, the algorithm may be presented in the following way

```
// Serial Floyd algorithm
for (k = 0; k < n; k++)
    for (i = 0; i < n; i++)
        for (j = 0; j < n; j++)
            A[i,j] = min(A[i,j], A[i,k]+A[k,j]);
```

- The complexity of the Floyd algorithm is of  $n^3$  order

# SERIAL FLOYD ALGORITHM IMPLEMENTATION

## Step 2. Serial Implementation...

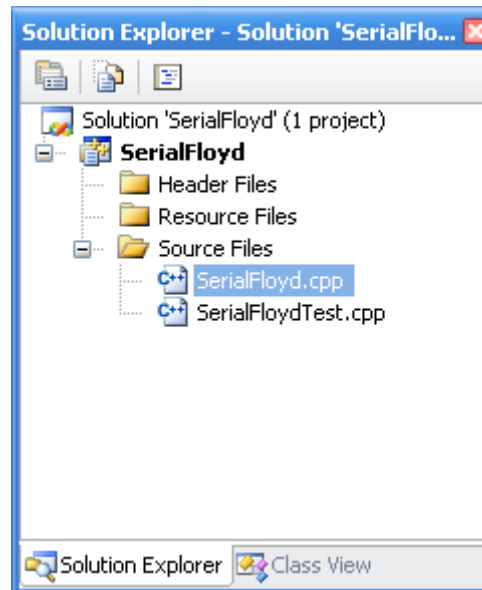

---

- ❑ Task 1 – Open the project SerialFloyd
- ❑ Task 2 – Input the Number of Vertices
- ❑ Task 3 – Terminate the Program Execution
- ❑ Task 4 – Implement the Floyd Algorithm
- ❑ Task 5 – Carry out the Computational Experiments

# Step 2. Serial Implementation...

## Task 1 – Open the project SerialFloyd

- ❑ Start **Microsoft Visual Studio**
- ❑ Open solution ParallelGauss.sln from the folder **c:\ParLabs\SerialFloyd**
- ❑ Open file **SerialFloyd.cpp** in the window Solution Explorer (Ctrl+Alt+L)

# Step 2. Serial Implementation...

## Task 2 – Input the Number of Vertices

- ❑ To set the initial data of the serial Floyd algorithm develop the function **ProcessInitialization()**
- ❑ This function is intended for
  - the initialization of all the variables used in the program
  - the input of the number of the processed vertices (the adjacency matrix size)
  - the allocation of the memory for the adjacency matrix
  - filling the memory with the initial values

```
// Function for process initialization  
void ProcessInitialiazation(int *&pMatrix, int& Size);
```

# Step 2. Serial Implementation...

## Task 2 – Input the Number of Vertices

- ❑ Implement the functions **DummyDataInitialization()**
- ❑ Use the simple method of implementation, containing the set of data, the correctness of which can be easily checked

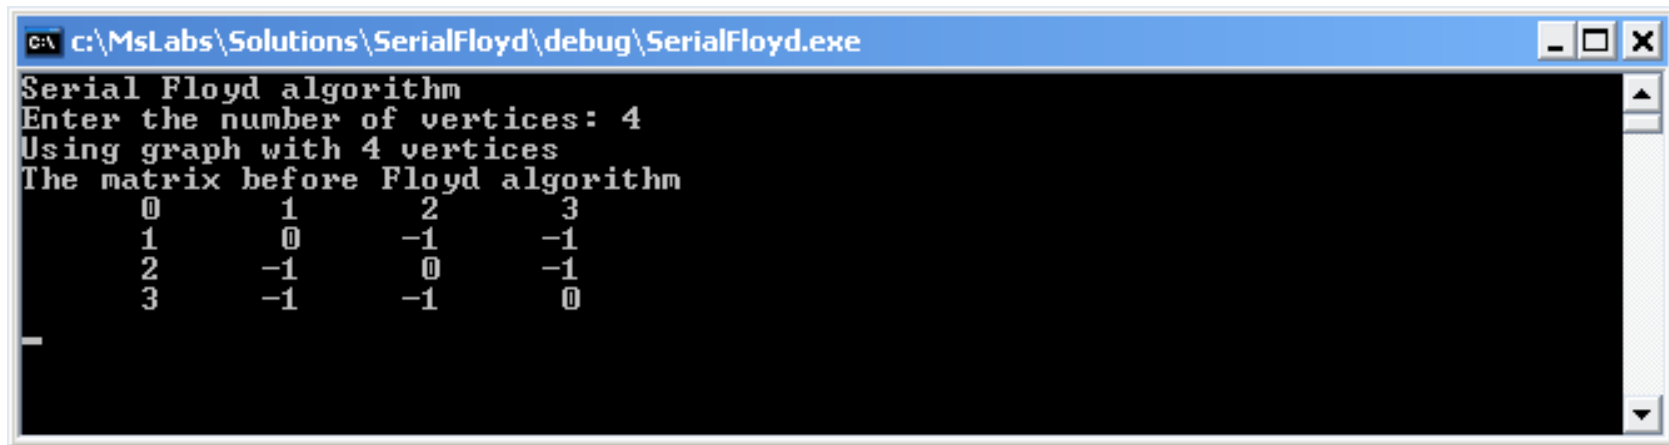

```
// Function for simple setting the initial data  
void DummyDataInitialization(int *pMatrix, int Size);
```

# Step 2. Serial Implementation...

## Task 2 – Input the Number of Vertices

- ❑ Develop the function `ProcessInitialization()`, `DummyDataInitialization()` and `PrintMatrix()`
- ❑ Call the functions `ProcessInitialization()` and `PrintMatrix()` from main function of the application
- ❑ Compile and run the application

```
c:\MsLabs\Solutions\SerialFloyd\debug\SerialFloyd.exe
Serial Floyd algorithm
Enter the number of vertices: 4
Using graph with 4 vertices
The matrix before Floyd algorithm
  0   1   2   3
  1   0  -1  -1
  2  -1   0  -1
  3  -1  -1   0
```

# Step 2. Serial Implementation...

## Task 3 –Terminate the Program Execution

- ❑ The function for correct program termination

**ProcessTermination()**

```
// Function for computational process termination  
void ProcessTermination(int *pMatrix);
```

- ❑ The function **ProcessTermination()** should be called at the end of the function **main()**

# Step 2. Serial Implementation...

## Task 4 – Implement the Floyd Algorithm

- ❑ To execute the Floyd algorithm develop the function **SerialFloyd()**

```
// Serial Floyd algorithm  
void SerialFloyd(int *pMatrix, int Size);
```

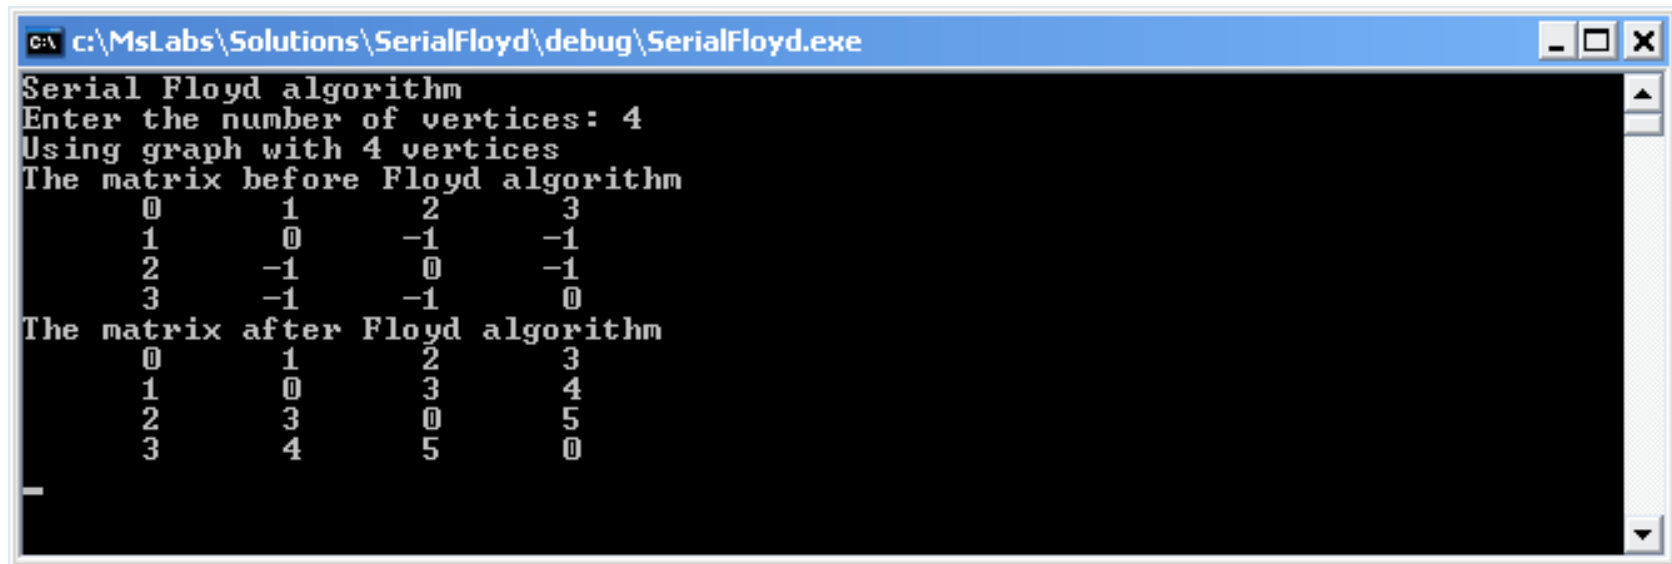

- ❑ The value -1 has been chosen to denote the infinitely. Implement the function **Min()**

```
int Min(int A, int B) {  
    int Result = (A < B) ? A : B;  
    if((A < 0) && (B >= 0)) Result = B;  
    if((B < 0) && (A >= 0)) Result = A;  
    if((A < 0) && (B < 0)) Result = -1;  
    return Result;  
}
```

# Step 2. Serial Implementation...

## Task 4 – Implement the Floyd Algorithm

- ❑ Implement the function `SerialFloyd()`
- ❑ Add debugging print to the function `main()`
- ❑ Compile and run the application

```
c:\MsLabs\Solutions\SerialFloyd\debug\SerialFloyd.exe
Serial Floyd algorithm
Enter the number of vertices: 4
Using graph with 4 vertices
The matrix before Floyd algorithm
  0   1   2   3
  1   0  -1  -1
  2  -1   0  -1
  3  -1  -1   0
The matrix after Floyd algorithm
  0   1   2   3
  1   0   3   4
  2   3   0   5
  3   4   5   0
```

# Step 2. Serial Implementation

## Task 5 – Carry out the Computational Experiments

- ❑ Develop the function **RandomDataInitialization()** for setting the data with random values (initialize the random generator by the current time value)

```
// Function for random generating the initial data  
void RandomDataInitialization(int *pMatrix, int Size);
```

- ❑ Call this function instead of the function **DummyDataInitialization()**
- ❑ Add time measurement and printing
- ❑ Carry out the computational experiments with large objects
- ❑ Fill the table with results of experiments

# PARALLEL FLOYD ALGORITHM

# Step 3. Parallel Algorithm...

## Subtask definition

- ❑ The effective way of parallel scheme of the Floyd algorithm is to update the values of matrix  $A$  simultaneously

## Analysis of Information Dependencies

- ❑ Computations in the subtasks become possible only if each subtask  $(i, j)$  contains the elements  $A_{ij}$ ,  $A_{ik}$ ,  $A_{kj}$  of the matrix  $A$
- ❑ Each element  $A_{kj}$  of the row  $k$  of the matrix  $A$  must be transmitted to all the subtasks  $(k, j)$ ,  $1 \leq j \leq n$ , and each element  $A_{ik}$  of the column  $k$  of the matrix  $A$  must be transmitted to all the subtasks  $(i, k)$ ,  $1 \leq i \leq n$

# Step 3. Parallel Algorithm...

## Analysis of Information Dependencies

- The Information Dependencies of the Basic Computational Subtasks (the arrows show the direction of exchanging values at iteration  $k$ )

# Step 3. Parallel Algorithm...

---

## Scaling and Distributing the Subtask among the Processors

- ❑ A possible way to aggregate the computations is to use of block-striped scheme of the matrix  $A$  partitioning
- ❑ This approach corresponds to uniting in one basic subtask the computations connected with updating the elements of one or several rows (horizontal partitioning) or columns (vertical partitioning) of matrix  $A$
- ❑ We will further analyze only partitioning the matrix  $A$  into **horizontal stripes**

# PARALLEL FLOYD PROGRAM

# Step 4. Parallel Program...

---

- ❑ Task 1 – Open the Project ParallelFloyd
- ❑ Task 2 – Initialize and Finalize the Parallel Program
- ❑ Task 3 – Input the Initial Data
- ❑ Task 4 – Terminate the Calculations
- ❑ Task 5 – Distribute the Data among the Processes
- ❑ Task 6 – Implement the Parallel Floyd Algorithm
- ❑ Task 7 – Implement the Floyd Algorithm Iterations
- ❑ Task 8 – Collect the Result Matrix
- ❑ Task 9 – Test the Parallel Program Correctness
- ❑ Task 10 – Carry out the Computational Experiments

# Step 4. Parallel Program...

## Task 1 – Open the Project ParallelFloyd

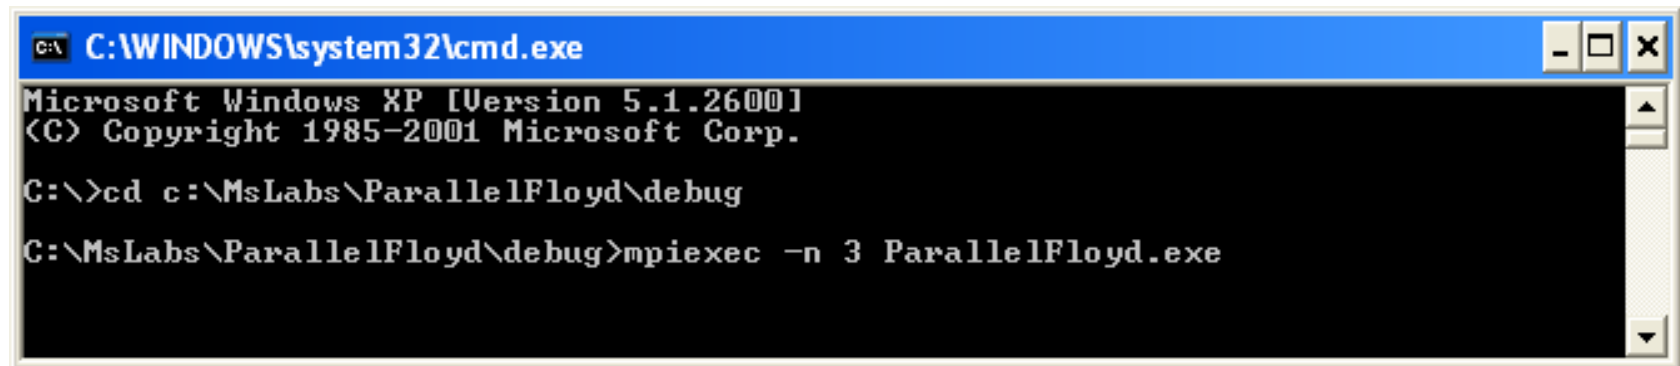

- ❑ Start **Microsoft Visual Studio**
- ❑ Open solution **ParallelFloyd.sln** from the folder **c:\ParLabs\ParallelFloyd**
- ❑ Open file **ParallelFloyd.cpp** in the window **Solution Explorer** (Ctrl+Alt+L)

# Step 4. Parallel Program...

## Task 2 – Initialize and Finalize the Parallel Program

- ❑ Initialize the environment of the MPI program execution in the main function
- ❑ Determine the number of processes available for MPI program
- ❑ Determine the process rank in communicator **MPI\_COMM\_WORLD**
- ❑ Set global variables for storing these values (**ProcNum** and **ProcRank** correspondingly)
- ❑ Compile and run the parallel application

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\>cd c:\MsLabs\ParallelFloyd\debug
C:\MsLabs\ParallelFloyd\debug>mpiexec -n 3 ParallelFloyd.exe
```

# Step 4. Parallel Program...

## Task 3 – Input the Initial Data

- ❑ To initialize the computations develop the function **ProcessInitialization**
  - input the amount of the number of vertices in the graph
  - broadcast the number of vertices to the other processes
  - allocate memory for the adjacency matrix and the stripes assigned to the processes

```
// Function for process initialization  
void ProcessInitialiazation(int *&pMatrix,int *&pProcRows,  
    int& Size, int& RowNum);
```

- ❑ Implement the function **ProcessInitialization()**
- ❑ Call the function from the main function of application
- ❑ Compile and run the application

# Step 4. Parallel Program...

## Task 4 –Terminate the Calculations

- ❑ Develop the function for correct program termination

**ProcessTermination()**

- ❑ Deallocate the memory for storing the adjacency matrix **pMatrix** (on the root process), and the memory for storing the matrix stripes **pProcRows**

```
// Function for computational process termination
void ProcessTermination(int *pMatrix, int *pProcRows) {
    if(ProcRank == 0)
        delete [] pMatrix;
        delete [] pProcRows;
}
```

- ❑ Call the function from the main function of application
- ❑ Compile and run the application

# Step 4. Parallel Program...

## Task 5 – Distribute the Data among the Processes

- ❑ In accordance with the parallel computation scheme the adjacency matrix must be distributed among the processes in equal stripes
- ❑ To distribute the matrix **pMatrix** use the function **MPI\_Scatterv()**
- ❑ Implement the function **DataDistribution()**

```
// Data distribution among the processes  
void DataDistribution(int *pMatrix, int *pProcRows,  
    int Size, int RowNum);
```

# Step 4. Parallel Program...

## Task 5 – Distribute the Data among the Processes

- ❑ Call the function **DataDistribution()** from the main program
- ❑ To test the correctness of the data distribution among the processes implement the “debugging print” function **TestDistribution()**
  - Print the adjacency matrix **pMatrix** on the root process
  - Print the matrix stripes, which are distributed on each of the processes

```
// Data distribution among the processes  
void TestDistribution(int *pMatrix, int *pProcRows,  
    int Size, int RowNum);
```

# Step 4. Parallel Program...

## Task 5 – Distribute the Data among the Processes

- ❑ Make sure that the data is distributed correctly

```
C:\WINDOWS\system32\cmd.exe
C:\MsLabs\ParallelFloyd\debug>mpiexec -n 3 ParallelFloyd.exe
Parallel Floyd algorithm
Enter the number of vertices: 6
Using graph with 6 vertices
Initial adjacency matrix:
  0   1   2   3   4   5
  1   0  -1  -1  -1  -1
  2  -1   0  -1  -1  -1
  3  -1  -1   0  -1  -1
  4  -1  -1  -1   0  -1
  5  -1  -1  -1  -1   0
ProcRank = 0
Proc rows:
  0   1   2   3   4   5
  1   0  -1  -1  -1  -1
ProcRank = 1
Proc rows:
  2  -1   0  -1  -1  -1
  3  -1  -1   0  -1  -1
ProcRank = 2
Proc rows:
  4  -1  -1  -1   0  -1
  5  -1  -1  -1  -1   0
C:\MsLabs\ParallelFloyd\debug>_
```

# Step 4. Parallel Program...

## Task 6 – Implement the Parallel Floyd Algorithm

- ❑ In accordance with the general scheme of the parallel Floyd algorithm it is necessary to carry out **Size** times the operation, which updates the adjacency matrix
  - All the processes need the matrix row, the number of which coincides with the iteration number
  - It is necessary to broadcast this row among the processes
  - Implement the function **RowDistribution()**
  - It must use the row number  $k$  in order to find the process, to which the  $k$ -th adjacency matrix row belongs, and broadcast the row to the other processes

```
// Function for row broadcasting  
void RowDistribution(int *pProcRows, int Size, int RowNum,  
    int k, int *pRow);
```

# Step 4. Parallel Program...

## Task 6 – Implement the Parallel Floyd Algorithm

- ❑ The code for the parallel Floyd algorithm will look the following way at the first stage

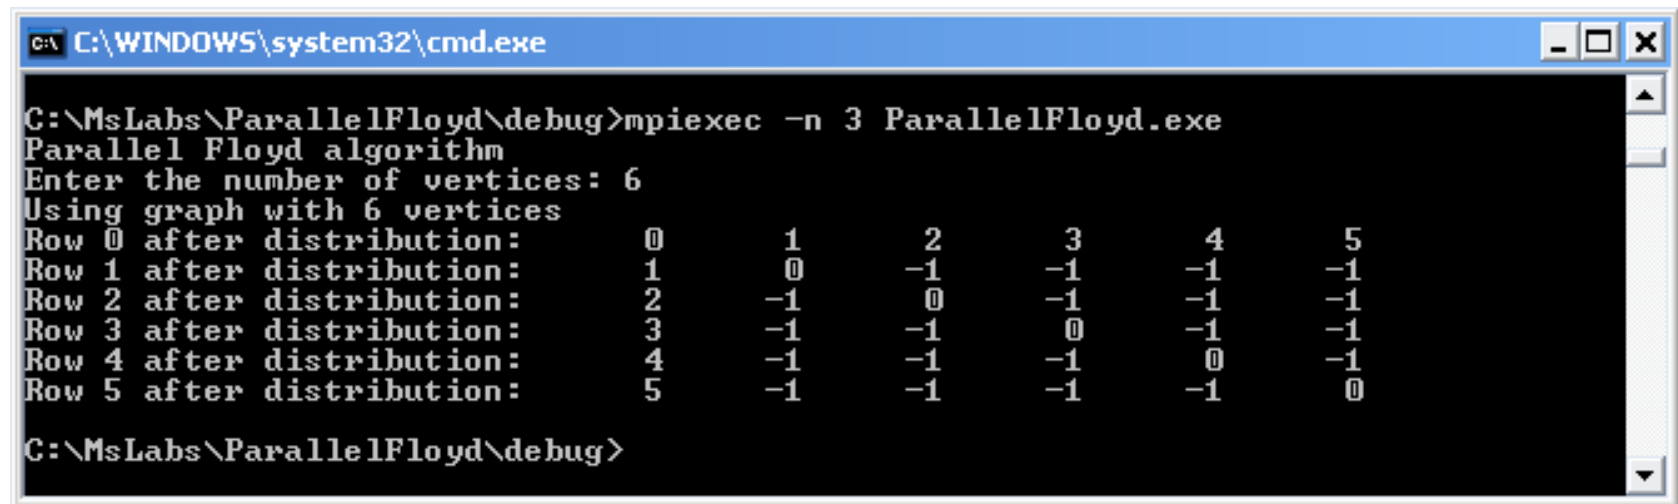

```
// Function for the parallel Floyd algorithm
void ParallelFloyd(int *pProcRows, int Size, int RowNum) {
    int *pRow = new int[Size];

    for (int k = 0; k < Size; k++) {
        // Distribute row among all processes
        RowDistribution(pProcRows, Size, RowNum, k, pRow);
    }
    delete [] pRow;
}
```

# Step 4. Parallel Program...

## Task 6 – Implement the Parallel Floyd Algorithm

- ❑ Implement the function `RowDistribution()`
- ❑ Call the function `ParallelFloyd()` from the main function of the application
- ❑ Compile and run the application
- ❑ Make sure that the data rows are distributed correctly

```
C:\WINDOWS\system32\cmd.exe

C:\MsLabs\ParallelFloyd\debug>mpiexec -n 3 ParallelFloyd.exe
Parallel Floyd algorithm
Enter the number of vertices: 6
Using graph with 6 vertices
Row 0 after distribution:  0      1      2      3      4      5
Row 1 after distribution:  1      0     -1     -1     -1     -1
Row 2 after distribution:  2     -1      0     -1     -1     -1
Row 3 after distribution:  3     -1     -1      0     -1     -1
Row 4 after distribution:  4     -1     -1     -1      0     -1
Row 5 after distribution:  5     -1     -1     -1     -1      0

C:\MsLabs\ParallelFloyd\debug>
```

# Step 4. Parallel Program...

## Task 7 – Implement the Floyd Algorithm Iterations

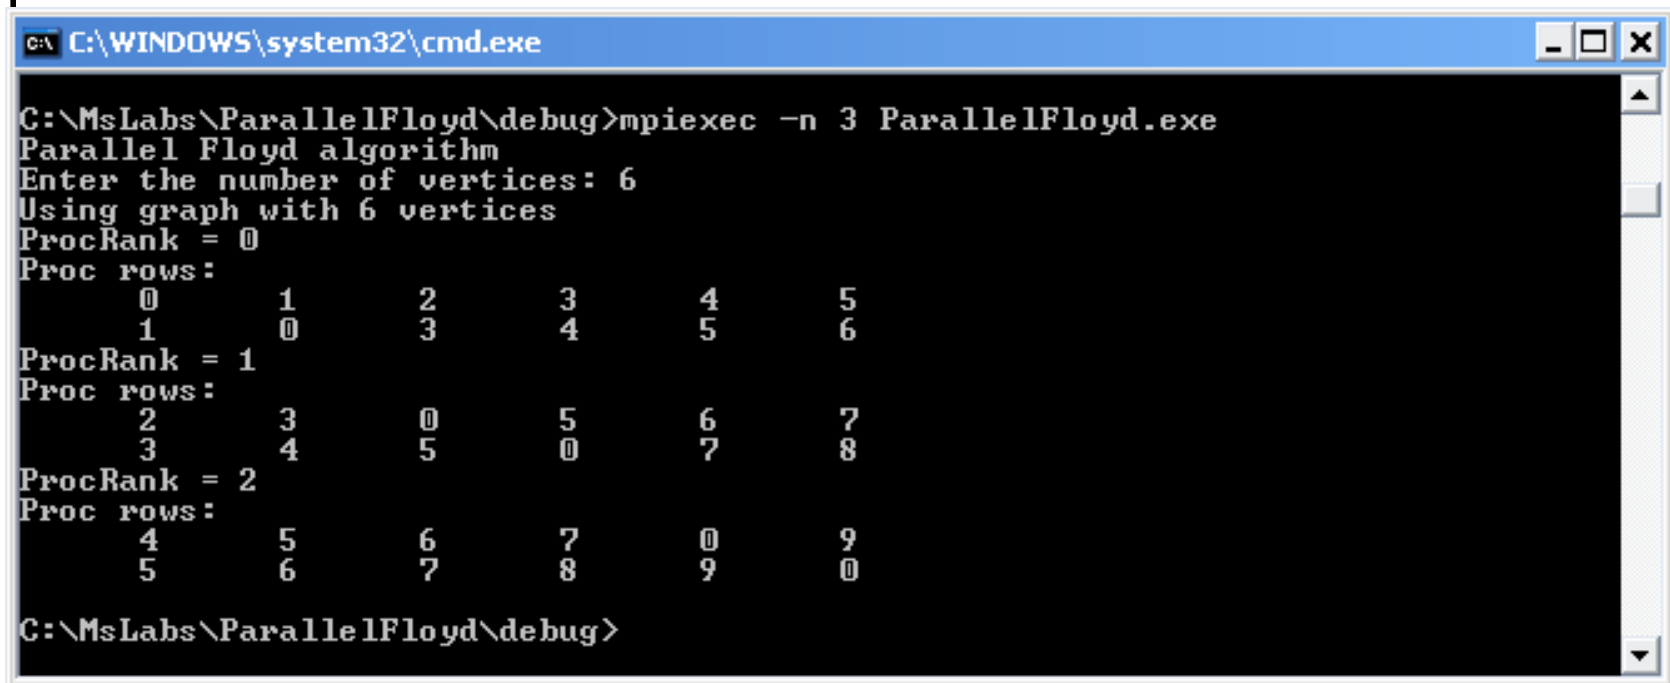

- ❑ It is necessary to execute the adjacency matrix update after broadcasting the next adjacency matrix row among the processes
- ❑ Add to the function **ParallelFloyd()** the following code on each iteration

```
// Update adjacency matrix elements
for (int i = 0; i < RowNum; i++)
    for (int j = 0; j < Size; j++)
        if ((pProcRows[i * Size + k] != -1) &&
            (pRow [j] != -1)) {
            t1 = pProcRows[i * Size + j];
            t2 = pProcRows[i * Size + k] + pRow[j];
            pProcRows[i * Size + j] = Min(t1, t2);
        }
```

# Step 4. Parallel Program...

## Task 7 – Implement the Floyd Algorithm Iterations

- ❑ Compile and run the application
- ❑ Check the correctness of the obtained partial results setting different number of processes and different number of the test graph vertices

```
C:\WINDOWS\system32\cmd.exe

C:\MsLabs\ParallelFloyd\debug>mpiexec -n 3 ParallelFloyd.exe
Parallel Floyd algorithm
Enter the number of vertices: 6
Using graph with 6 vertices
ProcRank = 0
Proc rows:
  0      1      2      3      4      5
  1      0      3      4      5      6
ProcRank = 1
Proc rows:
  2      3      0      5      6      7
  3      4      5      0      7      8
ProcRank = 2
Proc rows:
  4      5      6      7      0      9
  5      6      7      8      9      0

C:\MsLabs\ParallelFloyd\debug>
```

# Step 4. Parallel Program...

## Task 8 – Collect the Result Matrix

- ❑ To collect the obtained matrix on the root process implement the function **ResultCollection()**

```
// Function for process result collection  
void ResultCollection(int *pMatrix, int *pProcRows,  
    int Size, int RowNum);
```

- ❑ Call the function from main function of the application
- ❑ Add print of the obtained matrix by means of the function **PrintMatrix()** on the process with rank 0
- ❑ Compile and run the application
- ❑ Check the correctness of the program execution

# Step 4. Parallel Program...

## Task 9 – Test the Parallel Program Correctness

- ❑ To test the correctness of the program develop the function **TestResult()**

```
// Testing the result of parallel Floyd algorithm  
void TestResult(int *pMatrix, int *pSerialMatrix, int Size);
```

- ❑ The function should compare the results of the serial program to the results of the parallel one
- ❑ To execute the serial algorithm use the function **SerialFloyd()**
- ❑ To make the serial algorithm **SerialFloyd()** operate the same data as the developed parallel algorithm **ParallelFloyd()**, produce a copy of the data

# Step 4. Parallel Program...

---

## Task 9 – Test the Parallel Program Correctness

- ☐ Implement the function **TestResult()**
- ☐ Call the function from main function of the application
- ☐ Instead of the function **DummyDataInitialization()**, call the function **RandomDataInitialization()**
- ☐ Compile and run the application
- ☐ Set various amounts of the initial data
- ☐ Make sure that the application is functioning properly

# Step 4. Parallel Program

---

## Task 10 – Carry out the Computational Experiments

- ☐ Determine the parallel algorithm execution time
- ☐ Carry out the computational experiments with large objects
- ☐ Determine the given speedup
- ☐ Fill the table with results of experiments

# Summary

---

- ❑ Method of solving the shortest path problem (Floyd algorithm) is considered
- ❑ Serial and parallel versions of Floyd algorithm are implemented
- ❑ Computational experiments are performed, comparison of serial and parallel algorithms is made

# Exercises

---

- ❑ Study other parallel algorithms of graph processing:
  - the Prim algorithm for finding the minimum spanning tree
  - the Deijkstra method for solving the problem of finding the shortest path from one of the graph vertices to the other
- ❑ Develop the programs, which implement these algorithms
